Flappy Bird Clone — Test Case Report

Project No.: 57 **Project Title:** Flappy Bird Clone

Language: Python 3 **Library:** Pygame

These checks use the movement rules and values in the project allocation sheet. They verify frame calculations, boundary conditions and the pipe-passing rule. This is a logic-check report, not a set of screenshots from a live game.

Test case	Expected result	Observed logic result	Status
1. Normal input	Frame 1: velocity 1, y 301; Frame 2: velocity 2, y 303	Frame 1: velocity 1, y 301; Frame 2: velocity 2, y 303	PASS
2(a). Bottom boundary	Bird reaches/passes the ground boundary; Game Over	After frame: y 571, bottom 601; ground collision is true	PASS
2(b). SPACE near top	velocity -9, y -4; Game Over	velocity -9, y -4; top collision is true	PASS
3. Invalid key (Z)	Key ignored; velocity 1, y 301	velocity 1, y 301	PASS
4(a). SPACE with starting velocity 5	velocity -9, y 291	velocity -9, y 291	PASS
4(b). Pipe passed	Pipe right edge 99 is left of bird x=100; score +1	Pipe right edge 99; pass condition is True	PASS

Result: 6 out of 6 logic checks passed.

Before final submission, run one.py on your computer, check the controls and visuals, and add your own gameplay screenshots if your instructor requires them.
